

Introduction and lists

DATA TYPES FOR DATA SCIENCE IN PYTHON

Jason Myers
Instructor

Data types

- Data type system sets the stage for the capabilities of the language
- Understanding data types empowers you as a data scientist

Container sequences

- Hold other types of data
- Used for aggregation, sorting, and more
- Can be mutable (list, set) or immutable (tuple)
- Iterable

Lists

- Hold data in order it was added
- Mutable
- Index

Accessing single items in list

```
cookies = ['chocolate chip', 'peanut butter', 'sugar']
```

```
cookies.append('Tirggel')
```

```
print(cookies)
```

```
['chocolate chip', 'peanut butter', 'sugar', 'Tirggel']
```

```
print(cookies[2])
```

```
sugar
```

Combining Lists

- Using operators, you can combine two lists into a new one

```
cakes = ['strawberry', 'vanilla']
```

```
desserts = cookies + cakes
```

```
print(desserts)
```

```
['chocolate chip', 'peanut butter', 'sugar', 'Tirggel',  
'strawberry', 'vanilla']
```

- `.extend()` method merges a list into another list at the end

Finding Elements in a List

- `.index()` method locates the position of a data element in a list

```
position = cookies.index('sugar')  
  
print(position)
```

```
3
```

```
cookies[3]
```

```
'sugar'
```

Removing Elements in a List

- `.pop()` method removes an item from a list and allows you to save it

```
name = cookies.pop(position)  
  
print(name)
```

```
sugar
```

```
print(cookies)
```

```
['chocolate chip', 'peanut butter', 'Tirggel']
```

Iterating over lists

- `for` loops are the most common way of iterating over a list

```
for cookie in cookies:  
    print(cookie)
```

```
chocolate chip  
peanut butter  
Tirggel
```

Sorting lists

- `sorted()` function sorts data in numerical or alphabetical order and returns a new list

```
print(cookies)
```

```
['chocolate chip', 'peanut butter', 'Tirggel']
```

```
sorted_cookies = sorted(cookies)
```

```
print(sorted_cookies)
```

```
['Tirggel', 'chocolate chip', 'peanut butter']
```

Let's practice!

DATA TYPES FOR DATA SCIENCE IN PYTHON

Meet the Tuples

DATA TYPES FOR DATA SCIENCE IN PYTHON

Jason Myers
Instructor

Tuple, Tuple

- Hold data in order
- Index
- *Immutable*
- Pairing
- Unpackable

Zippping tuples

- Tuples are commonly created by zipping lists together with `zip()`
- Two lists: `us_cookies` , `in_cookies`

```
top_pairs = list(zip(us_cookies, in_cookies))  
print(top_pairs)
```

```
[('Chocolate Chip', 'Punjabi'), ('Brownies', 'Fruit Cake Rusk'),  
( 'Peanut Butter', 'Marble Cookies'), ('Oreos', 'Kaju Pista Cookies'),  
( 'Oatmeal Raisin', 'Almond Cookies')]
```

Unpacking tuples

- Unpacking tuples is a very expressive way for working with data

```
us_num_1, in_num_1 = top_pairs[0]  
print(us_num_1)
```

```
Chocolate Chip
```

```
print(in_num_1)
```

```
Punjabi
```

More unpacking in Loops

- Unpacking is especially powerful in loops

```
for us_cookie, in_cookie in top_pairs:  
    print(in_cookie)  
    print(us_cookie)
```

```
Punjabi  
Chocolate Chip  
Fruit Cake Rusk  
Brownies  
# ..etc..
```

Enumerating positions

- Another useful tuple creation method is the `enumerate()` function
- Enumeration is used in loops to return the position and the data in that position while looping

```
for idx, item in enumerate(top_pairs):  
    us_cookie, in_cookie = item  
    print(idx, us_cookie, in_cookie)
```

```
(0, 'Chocolate Chip', 'Punjabi')  
(1, 'Brownies', 'Fruit Cake Rusk')  
# ..etc..
```

Be careful when making tuples

- Use `zip()`, `enumerate()`, or `()` to make tuples

```
item = ('vanilla', 'chocolate')  
print(item)
```

```
('vanilla', 'chocolate')
```

- Beware of trailing commas!

```
item2 = 'butter',  
print(item2)
```

```
('butter',)
```

Let's practice!

DATA TYPES FOR DATA SCIENCE IN PYTHON

Sets for unordered and unique data

DATA TYPES FOR DATA SCIENCE IN PYTHON

Jason Myers
Instructor

Set

- Unique
- Unordered
- Mutable
- Python's implementation of Set Theory from Mathematics

Creating Sets

- Sets are created from a list

```
cookies_eaten_today = ['chocolate chip', 'peanut butter',  
    ...: 'chocolate chip', 'oatmeal cream', 'chocolate chip']  
types_of_cookies_eaten = set(cookies_eaten_today)  
print(types_of_cookies_eaten)
```

```
set(['chocolate chip', 'oatmeal cream', 'peanut butter'])
```

Modifying Sets

- `.add()` adds single elements
- `.update()` merges in another set or list

```
types_of_cookies_eaten.add('biscotti')  
  
types_of_cookies_eaten.add('chocolate chip')  
  
print(types_of_cookies_eaten)
```

```
set(['chocolate chip', 'oatmeal cream', 'peanut butter', 'biscotti'])
```

Updating Sets

```
cookies_hugo_ate = ['chocolate chip', 'anzac']  
  
types_of_cookies_eaten.update(cookies_hugo_ate)  
  
print(types_of_cookies_eaten)
```

```
set(['chocolate chip', 'anzac', 'oatmeal cream',  
    'peanut butter', 'biscotti'])
```

Removing data from sets

- `.discard()` safely removes an element from the set by value
- `.pop()` removes and returns an arbitrary element from the set (KeyError when empty)

```
types_of_cookies_eaten.discard('biscotti')  
print(types_of_cookies_eaten)
```

```
set(['chocolate chip', 'anzac', 'oatmeal cream', 'peanut butter'])
```

```
types_of_cookies_eaten.pop()  
types_of_cookies_eaten.pop()
```

```
'chocolate chip'  
'anzac'
```

Set Operations - Similarities

- `.union()` set method returns a set of all the names (`or`)
- `.intersection()` method identifies overlapping data (`and`)

```
cookies_jason_ate = set(['chocolate chip', 'oatmeal cream',  
                        'peanut butter'])  
cookies_hugo_ate = set(['chocolate chip', 'anzac'])  
cookies_jason_ate.union(cookies_hugo_ate)
```

```
set(['chocolate chip', 'anzac', 'oatmeal cream', 'peanut butter'])
```

```
cookies_jason_ate.intersection(cookies_hugo_ate)
```

```
set(['chocolate chip'])
```

Set Operations - Differences

- `.difference()` method identifies data present in the set on which the method was used that is not in the arguments (`-`)
- Target is important!

```
cookies_jason_ate.difference(cookies_hugo_ate)
```

```
set(['oatmeal cream', 'peanut butter'])
```

```
cookies_hugo_ate.difference(cookies_jason_ate)
```

```
set(['anzac'])
```
